KPV

What is KPV?

KPV is the C-terminal peptide fragment of alpha-melanocyte stimulating hormone (alpha-MSH). It is a potent anti-inflammatory peptide that has shown promise in a number of disease conditions. The most active research is in the treatment of inflammatory bowel disease where the peptide has shown substantial promise. Research in wound healing also reveals that KPV may offer a host of benefits that speed wound healing, reduce infection, fight inflammation, and lead to better cosmetic results. KPV has also been shown to aid in scar reduction after surgery.

Indications:

- Reduces intestinal inflammation
- General anti-inflammatory
- Wound healing
- Scar formation

What you need to know:

KPV exhibits minimal side effects. It has also been shown in animal studies to be safe and effective when administered orally.

PATIENT BENEFIT:

IMPROVES HEALING OF WOUNDS
