VIP

What is VIP Peptide (Vasoactive Intestinal Peptide)?

VIP (Vasoactive Intestinal Peptide) is a naturally occurring substance in your body that acts as a chemical messenger in the brain and throughout the nervous system. It plays an important role in keeping your body balanced and functioning well.

What does VIP do in the body?

- Helps relax and widen blood vessels (improving blood flow)
- Supports digestion by helping the muscles and lining of the gut work properly
- Balances immune system activity
- Reduces inflammation
- Helps regulate hormone levels
- Supports brain healing and function

Why is VIP used as a therapy?:

VIP peptide therapy is often used for people with chronic inflammatory illnesses such as mold toxicity or other biotoxin-related conditions. These illnesses can cause the body to overreact to environmental triggers, leading to long-term symptoms.
By using VIP in a nasal spray form, this therapy may help:

- Calm inflammation in the body and brain
- Regulate your immune system to reduce overactive responses
- Improve energy, mood, and mental clarity
- Support hormone balance
- Help the body recover from long-term

How is VIP given?

VIP is usually taken as a nasal spray for easy absorption and direct access to the brain and nervous system. Your healthcare provider will guide you on how and when to use.
